# SAGA

A Simple API for Grid Applications

## Introduction to the SAGA API

omii-uk  
[www.omii.ac.uk](http://www.omii.ac.uk)

## Agenda

- ▣ background recap
- ▣ API structure and scope
- ▣ API walkthrough
- ▣ implementation details
- ▣ API extensions

## Grid APIs and Frameworks

- Middleware often targets legacy applications (Unicore, Globus, Condor, ...)
- some are distribution aware (MPICH-G, Ninf-G, . . . )
- few APIs exist for Grid aware applications
  - GridFTP/GRAM
  - DRMAA
  - gLite
  - CoG
  - GAT
  - Cloud APIs

## Grid APIs and Frameworks

- ▣ diversity of Grid Middleware implies diversity of APIs
  - ▣ some APIs try to generalize Grid programming concepts
  - ▣ difficult to keep up with MW development, and to stay **simple**
-

## Open Grid Forum (OGF)

- The Open Grid Forum (aka GF, EGF, GGF) standardizes distributed computing infrastructures/MW
- e.g. standardized job description language (JSDL)
- focuses on interfaces, but also protocols, architecture, APIs

## APIs within OGF

- ▣ OGF focuses on services
- ▣ some effort on higher level APIs
  - ▣ Distributed Resource Management Application API (DRMAA)
  - ▣ Remote Procedure Calls (GridRPC)
  - ▣ Checkpoint and Recovery (GridCPR)
  - ▣ Job Submission and Description Language (JSDL)
- ▣ numerous service interfaces, often WS-based (WSRF)

## OGF: DRMAA

- implementable on all major resource management services
- simple means to define and submit jobs
- basic job management features (status, kill)
- job templates for bulk job management
- DRMAA.v2 is expected by end of 2010 – OO, extended, SAGA aligned

## DRMAA Example

```
drmaa_job_template_t * job_template;

if ( ! ( job_template = create_job_template (exe, 5, 0) ) )
{
    fprintf (stderr, "create_job_template failed\n");
    return 1;
}

while ( ( drmaa_errno = drmaa_run_job (job_id,
                                      sizeof (jobid)-1,
                                      job_template,
                                      diagnosis,
                                      sizeof (diagnosis)-1) )
        == DRMAA_ERRNO_DRM_COMMUNICATION_FAILURE )
{
    fprintf (stderr, "drmaa_run_job failed: %s\n", diagnosis);
    sleep (1);
}
```

## OGF: GridRPC

- ▣ standardizes the three existing RPC implementations for Grids
- ▣ example of '*gridified API*'
- ▣ simple: get function handle, call function
- ▣ explicit support for async rpc calls
- ▣ gridrpc.v2 adds support for remote data handles

## OGF: GridRPC

```
double A[N*N], B[N*N], C[N*N];

initMatA (N, A);
initMatB (N, B);

grpc_initialize (argv[1]);

grpc_function_handle_t handle;
grpc_function_handle_default (&handle, "mat_mult");

if ( grpc_call (&handle, N, A, B, C) != GRPC_NO_ERROR )
{
    exit (1);
}

grpc_function_handle_destruct (&handle);
grpc_finalize ();
```

## OGF: GridCPR

- ▣ Grids seem to favor application level checkpointing
- ▣ GridCPR allows to manage checkpoints
- ▣ defines an architecture, service interfaces, and scope of client API
- ▣ a SAGA extensions exists with a matching client API

## OGF: JSDL

- ▣ extensible XML based language for describing job requirements
- ▣ does not cover resource description (on purpose) does not cover workflows, or job dependencies etc (on purpose)
- ▣ JSDL is extensible (ParameterSweep, SPMD, ...)

## OGF: JSDL

```
<jSDL:JobDefinition>
  <JobDescription>
    <Application>
      <jSDL-posix:POSIXApplication>
        <Executable>/bin/date</Executable>
      </jSDL-posix:POSIXApplication>
    </Application>
    <Resources ...>
      <OperatingSystem>
        <OperatingSystemType>
          <OperatingSystemName>LINUX</OperatingSystemName>
        </OperatingSystemType>
      </OperatingSystem>
    </Resources>
  </JobDescription>
</jSDL:JobDefinition>
```

## OGF: JSDL

- ▣ XML: embeddable into WSRF (WS-Agreement etc.)
- ▣ XML, but relatively flat
- ▣ maps well to existing JDLs, but is 'more complete'
- ▣ extensible (resource description, job dependencies, workflow)
- ▣ top down approach!

## OGF: Summary

- some API specs exist in OGF, and are successful
- OGF APIs do not cover the complete OGF scope
- the various API standards are disjoint
- WSDL as service interface specification cannot replace an application level API (wrong level of abstraction)
- **SAGA tries to address these issues**

## OGF: top-down vs. bottom-up

- ▣ bottom-up often agrees on (semantic) LCD + backend specific extensions
- ▣ top-down usually focuses on semantics of application requirements
- ▣ bottom-up tends to be more powerful
- ▣ top-down tends to be simpler and more concise
- ▣ ***we very much prefer top-down!***

## SAGA Design Principles

- ▣ SAGA: Simple API for Grid Applications
  - ▣ OGF approach to a uniform API layer (facade)
- ▣ governing principle: 80:20 rule
  - ▣ simplicity versus control!
- ▣ top-down approach
  - ▣ use case driven!
  - ▣ defines application level abstractions
- ▣ extensible
  - ▣ stable look & feel
  - ▣ API packages
- ▣ API Specification is language independent (IDL)
  - ▣ Renderings exist in C++, Python, Java
  - ▣ Examples here are in C++

## SAGA Intro: Example 1

```
// SAGA: File Management example

saga::filesystem::directory dir ("any://remote.host.net//data/");

if ( dir.exists ("a") && ! dir.is_dir ("a") )
{
    dir.copy ("a", "b", Overwrite);
}

list <saga::url> names = dir.find ("*-{123}.txt");

saga::filesystem::directory tmp  = dir.open_dir ("tmp/", Create);
saga::filesystem::file      file = dir.open      ("tmp/data.txt");
```

## SAGA Intro: Example

- ▣ API is clearly POSIX (libc + shell) inspired
  - ▣ where is my security??
  - ▣ what is 'any:/' ???
-

## SAGA Intro: Example

```
// SAGA: Job Submission example

saga::job::description jd;
// details left out

saga::job::service js ("any://remote.host.net/");
saga::job::job      j = js.create_job (jd);

j.run ();

cout << "Job State: " << j.get_state () << endl;

j.wait ();

cout << "Retval " << j.get_attribute ("ExitCode") << endl;
```

## SAGA Intro: Example 2'

```
// SAGA: Job Submission example
```

```
saga::job::service js ("any://remote.host.net");  
saga::job::job      j = js.run_job ("touch /tmp/touch.me");
```

```
cout << "Job State: " << j.get_state () << endl;
```

```
j.wait ();
```

```
cout << "Retval " << j.get_attribute ("ExitCode") << endl;
```

## SAGA Intro: Example 2

- ▣ stateful objects!
- ▣ yet another job description language? :-(
- ▣ many hidden/default parameters
  - ▣ keeps call signatures small
- ▣ 'any:/' again!
- ▣ TIMTOWTDI (there is more than one way to do it)

## SAGA Intro: 10.000 feet

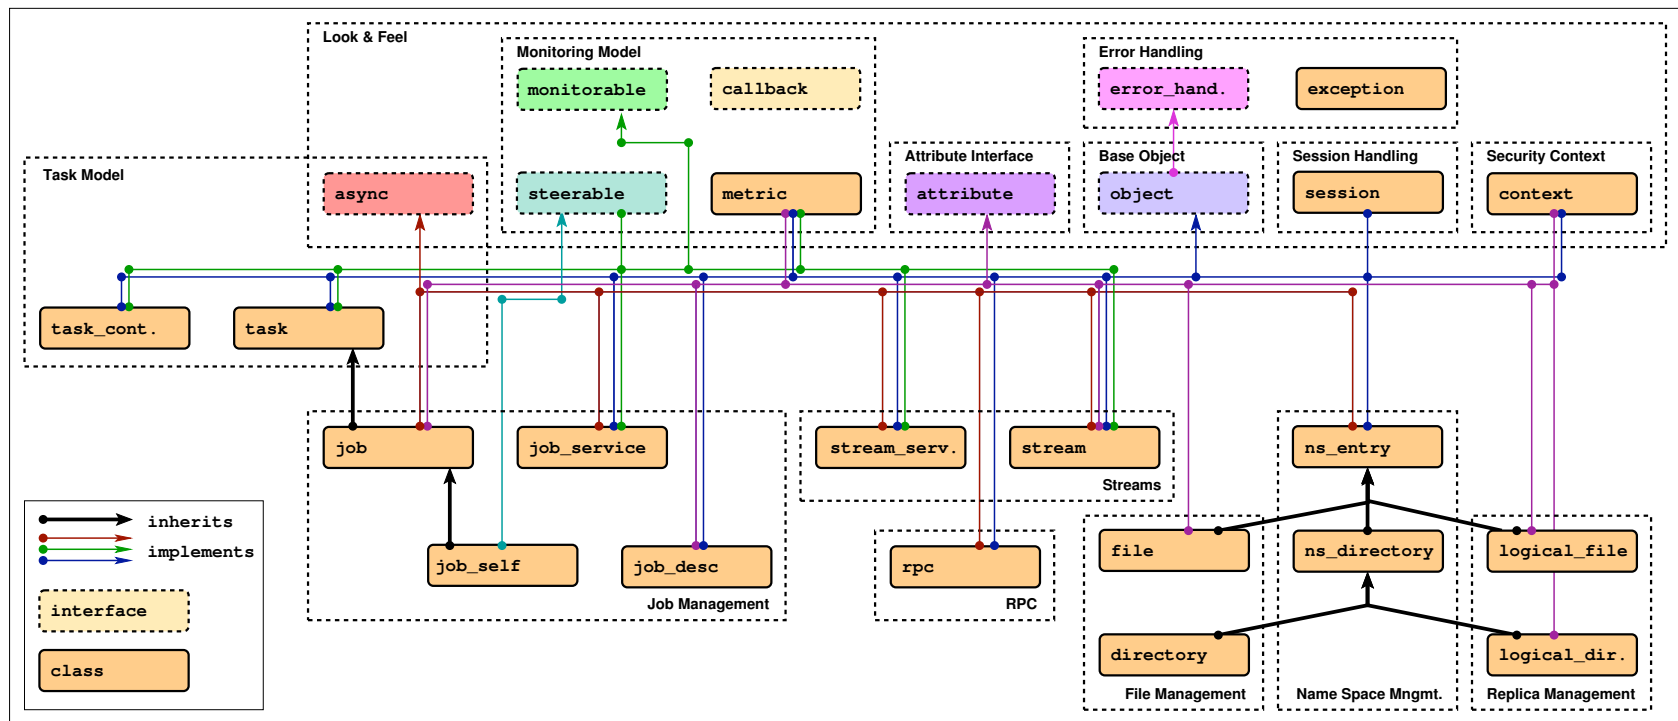

- object oriented: inheritance, interfaces very moderate use of templates though!
- functional and non-functional elements strictly separated
  - non-functional API:
    - look & feel: orthogonal to functional API
    - typically not mappable to remote operations
  - functional API:
    - API 'Packages' extensible
    - typically mappable to remote operations
- few inter-package dependencies - allows for partial implementations
